We determine which terms shall be applied in tax analysis by revealing the differences between terminological apparatus of accounting and tax accounting by the way of use of comparative analysis and dialectic synthesis methods.

Several scientists engaging in learning of issues connected to the field of tax analysis presented and used certain terms and conceptions in their investigations. The most concepts for purposes of this research cover the follows: tax burden, operational tax costs, tax environment, tax discounts. The use of special terminology exists in official documents in one or other form concerning the tax analysis conducted by public authorities. It is required to analyze and generalize these terms in order to conduct the said research.

Formed as a result of the synthesis of a number of special and sectoral areas of scientific knowledge, and only in the 20th century became an independent science, economic analysis, under the influence of the newly emerging needs of practice, creates new promising scientific areas, one of which is tax analysis as a tool for assessing results and consequences taxation.

The development of strategic management at the organization level has led to the emergence of tax planning as an element of the organization’s financial management in order to reduce the negative impact of taxation on the results of operations, the implementation of which requires the development of tax analysis procedures. Recognition of the active role of the external environment in the activities of the organization made it possible to rethink the meaning of tax analysis, without limiting its task of “optimization” of tax expenditures. For the harmonious interaction of the organization with the surrounding socio-economic environment, tax analysis ensures the alignment of interests in the taxation process, reflecting the relationship between structural levels — public finance and the finance of business entities as agents of economic relations. The development of a conceptual theoretical basis for the interpretation of performance, taking into account the impact of taxation, opens up opportunities for solving a number of practical problems, including one of the main ones being the coordination of the interests of the state and business, which directly determine the sustainable socio-economic development of Azerbaijan.

Дослідники в області податкового аналізу ввели і використовували в своїх дослідженнях певні терміни і поняття. Більшість концепцій з метою цього дослідження охоплюють таке: податковий тягар, операційні податкові витрати, податкове середовище, податкові пільги. В офіційних документах в тій чи іншій формі також використовується специфічна термінологія, що стосується податкового аналізу, проведеної державними органами. Для проведення такового дослідження в статті проаналізовані та узагальнені ці терміни.

Слід зазначити, що в результаті синтезу ряду специфічних та галузевих областей наукового знання економічний аналіз у ХХ ст. став самостояльною галуззю науки. Під впливом потреб практики народжуються нові перспективні наукові напрями економічного аналізу, одним з яких є податковий аналіз. Виникнення податкового аналізу пов’язано з необхідністю оцінки та врахування впливу на результати господарської діяльності податкової системи, що впливає на фінансові інтереси різних груп економічних агентів. Накопичений практичний досвід дозволяє зробити перші кроки у визначенні предмета, методу і цілей податкового аналізу, які є фундаментальними концепціями, які підтверджують появу самостійного наукового напряму в економічному аналізі.

Економічний зміст податків виражається відносинами в формуванні державних фінансів. У процесі оподаткування, здійснюваного в рамках ієрархічної структури фінансової системи країни, податкові платежі відображають потоки фінансових ресурсів і взаємозв'язок між структурними рівнями — державними фінансами і фінансами господарюючих суб’єктів, як агентів економічних відносин. Одна із ключових проблем оподаткування — це неминучий конфлікт, що виникає в процесі реалізації функцій дер-
The practical need for a scientific approach to the study of the diversity of issues of economic analysis in different areas led to the isolation and development of its individual scientific directions. A knowledge system that studies the impact of taxation on conditions for the sustainable development of economic entities, forms a separate scientific direction — tax analysis. Meanwhile in economic analysis until recently, the study of these issues was not given due attention. At the same time, certain issues of tax analysis developed within the framework of other sciences, and the term "tax analysis" is mainly associated with macroeconomic level.

Modern business conditions of organizations in a market economy for making effective economic decisions dictate the need analysis of the whole variety of internal and external factors affecting financial and economic activities, including factors of tax expenses.

DEFINITION OF THE PROBLEM

The discounted taxation, simplification of taxation, its stability is one of the issues roused interest for entrepreneurs among priority directions of state collection. Recently, several changes made in the Tax Code of the republic will give an opportunity for creating of maximal efficient condition for the development of small business in the republic by the way of simplification of accounting system, simplification of tax burden of small entrepreneurial subjects in the country. The specialists think that, increase of tax burden for small entrepreneurial subjects is contrary to the logic of tax reforms and priorities of state policy in the field of stimulating of small business. So, tax burden calculated as comparison of CIP of taxes paid by tax payers in the country doesn’t take into account the different characteristics of payers, for example, the structure of production and turnover costs in regard to obtaining of their incomes. The main purpose of this policy is to provide the possibility of carrying out the level of profitability and other important factors. [3, p. 361].

In accordance with method called "reaganite economics" and used in USA at the beginning of 80s of the last century, the state mitigates tax burden by fixing minimal tax rates for entrepreneurs and decreases its costs and the costs directed to social program. The main purpose of this policy is to provide the possibility of carrying out the level of profitability and other important factors. [4, p. 235; 5, p. 356].

The economists think that, tax burden covers the responsibility of all tax payers before law. Because, putting of tax and duties on payers is protected by the state forms. So, taxes are accepted by competent authorities. So, putting of tax and duties on payers is protected by the state. [4, p. 235; 5, p. 356].

Principal part according to the theory of American economists prof. A.Laffer, increase of tax rates till certain level determines tax burden at micro level as indicator giving an opportunity to single description of business activity and its results necessary to conduct supervision over selection of management decisions and the impact of taxation to fulfillment of organizational functions by considering the impact of tax environment [1, p. 50].

T.V. Kulikova determines tax burden at micro level as indicator giving an opportunity to measure the number of results of mutual impacts with quantity among subjects of tax relations. The absolute tax burden is general amount of tax costs of economic entities collected for payment on certain period. The relative tax burden is amount of tax costs of economic entities connected with comparative base during a certain period [2]. The authors appeal to different taxes used in the literature, for example "tax burden", "the whole tax collection" and other such synonyms in many works analyzed on the existing research subject, in the term of "tax burden". According to us, the term of "tax burden" has been formed well, because it is used in the documents published in official sites of the Ministry of Taxes of the Republic of Azerbaijan and it comes across in special literature more. The term of "tax burden" is used in the source with English language.

Key words: tax analysis, tax burden, operational tax costs, tax environment, tax discounts.
country economy decreases. The economists think that, of
taxation level gives an opportunity to receive 40—50% of
the incomes from tax payers, this case will decrease the
interest of entrepreneur in initiative and expanding of
production [6, p. 134].

In general, the indicator of tax burden determined on
calculation burden may lead to serious shortages. The term
serious shortage consists of it that, this indicator doesn't
take into account the individual characteristics of concrete
tax payer. But, taxes are determined by the state, therefore
the calculation of this indicator has important significance.

As it is known, there are many enterprises differing one
other for types of activity and many features in every
country, this variety exerts its influence to formation of their
taxation base. Another aspect is that, it shall be acknowledged that, use
of these methods at the time of calculation of tax burden at
macro level is advisable.

The comparison of all tax amounts received from tax
payers with percentage in the capacity of CIP shall be found not
dependent on payment of tax to which level budget and
extra-budgetary funds to calculate tax burden indicator at
macro level is advisable. But we think that, such approaches to calculation
tax burden exclude the comparison of economic results of
different economic entities representing different fields of
different economic entities. Certainly, it shall be acknowledged that, use
of these methods at the time of calculation of tax burden at
macro level is advisable.

The research conducted shows that, real tax burden of
enterprises in our republic is considerable upper than
average indicator on the country. Therefore, we think that,
the characteristics of country economy shall be taken into
consideration at the time of impact of taxes to
taxation activity performed by the organization. The point is that, all of tax payers
were treated equally not depending on property form and
adapting to the tax system in the republic. Analysis shows that, the main tax
burden bears on certain, gradually limited tax payers. Therefore,
as confirmed by specialists, "...the problem of decreasing of tax burden in republican tax system is closely
regarded to expanding of taxation base, elimination of problem in payments in the economy and strengthening of fiscal control" [6, p. 142—143].

The research shows that, tax burden indicator calculated in comparison with CIP doesn't reflect exactly
the tension of tax liabilities on enterprises of separate sectors of
economy and different production fields. So, use of
comparative indicator reflecting tax burden of economic
agents is advisable. The current financial condition of
economic subjects engaging in entrepreneurial activity in
our republic and the present tendency of their development gives grounds to say that, 30—40% of comparative tax burden indicator calculated on the basis of value established newly in the country is more advisable. It shall be emphasized that, higher tax burden in leading fields of the economy weakens the entrepreneurial activity, also bankrupts their financial-economic work. Therefore, non-excess of maximal comparative tax burden level per any economic subject than
50% is recommended.

According to prof. Y. Kalbiyev, though discounted regime of taxation justified itself, "...the motive of its application during those years majoring in severe increase in tax revenues is very negative — it shall be evaded the taxation legally" [5, p. 106]. The economist-scientist thinks that, the negative role of this tax as official method of evasion from VAT at
the time of entering of special accounts may increase much
more. So, there is a need for establishment of efficient tax
environment within traditional VAT for small entrepreneur.
The important duty of tax analysis is evaluation of tax
consequences in references to economy, studying the influence of external and internal factors. The influence of
external factors is determined with impact of different
normative and legal acts to the activity determining the
running terms of economic subject. Internal factors — are
the whole of characteristics such as property form of
organization, organizational-legal form, types, character,
scope of activity, accepted accounting policy, etc.

Some scientists use the concept of tax environment in
their researches, which is a set of various factors related to
the taxation system that directly and indirectly affect the
activities of economic entities.

E.V. Chipurenko uses the term "indicators of tax environment" to determine the indicators obtained as a result of the
analysis of the tax environment. At the same time, indicators are distinguished by the scientist at three levels: at country
level, at the field level, at the organization level. Indicators of the tax environment at the organizational level are an
indicator of the tax burden, as well as the suitability of the
tax environment for the taxpayer [1, p. 76; 8, p. 60].

Tax liabilities are tax costs of the organization. In
the economic literature, it is accepted to distinguish between
costs such as costs of types such as costs of products, works and services by increasing the prime cost. The
amount of these taxes, in whole or in part, forms tax expenses as a
costs off to the production of materials, raw materials and others, then costs reduce the financial result. The organization's
costs are recognized as writing off of assets and (or) reduction of economic benefits as a result of creation of
liabilities caused to the reduction of capital [9, p. 147]. The
terms "expenses" and "costs" are used as synonyms in

In our opinion, all taxes calculated for any reason,
regardless of their actual payments, are expenses remaining
in the place, except for taxes, which are included in indirect
costs and then distributed among the types of products,
works and services by increasing the prime cost. The amount
of these taxes, in whole or in part, forms tax expenses as a
result of the sale or other failure of these products, works
or services until their prime cost are written off. Thus,
expenses are recognized as writing off of assets and (or)
reduction of economic benefits as a result of creation of
liabilities caused to the reduction of capital [9, p. 147]. The
terms "expenses" and "costs" are used as synonyms in

As the term "costs" isn't used in the normative legal acts on
accounting and taxation, then we will use the term
"operating tax expenses".

The organization's tax expenses on operations are costs
related to the application of the taxpayer's duties deter-
mined by the organization under the Tax Code, i.e. tax
accounting, issuance of tax declaration and other documents
necessary for tax control, elimination of detected violations of
tax legislation and other fulfillment.

The concept of tax regime, which understood as a certain
rule for the calculation and payment of taxes established by tax
legislation, as well as the concept of "compatibility of tax regimes", which allows the simultaneous application of
several tax regimes depending on the type of economic activity performed by the organization. In the
economic literature, the terms "tax regime" and "tax system" are used as synonyms.
Alternative taxation regimes — general taxation system (only alternative under certain conditions), simplified tax system, tax system for agricultural producers, as well as non-alternative, i.e. absolute tax regime were defined in the Tax Code. The alternative nature means the possibility of the selection of tax system if the necessary conditions determined by the economic entity in the Tax Code are met.

Optimization of taxation is an activity aimed at using the best possible options of methods and techniques of the regimes provided for in the tax legislation for the calculation of taxes, as well as discounts, allocations in order to reduce tax expenses and keep tax risks at an acceptable level.

In his study, Hoffman A.P. uses the term “tax corridor” which is presented by the scientist as “the establishment of a function of targeted optimization of taxation of the enterprise with minimal tax risk”. It presents the conception of lower and upper boundaries of the tax corridor [9, p. 147].

According to the scientist’s words, the lower limit of the tax corridor is the minimum quantity of the tax burden, in case the tax risk is not the maximum. The upper limit of the tax corridor is the maximum quantity of the tax burden if the efficiency of the financial and economic activities of the economic organization is maintained.

The term “tax field” is often used in tax planning and forecasting. The organization’s tax field is the set of taxes and their features provide by its tax regime.

Also, the term, which is often used in research related to the taxation, is the expression of “tax discount”. The tax discount is the reduction of tax base, the application of a lower tax rate and reduction of tax liability as a result of refund from the budget (recovery) and refund of tax compensation. It is necessary to distinguish the justified and unjustified tax discounts. The existence of unjustified tax discounts shows the illegal actions of the taxpayer.

CONCLUSION

1. The conduction of radical reforms in the tax system should, first of all, intend the application of tax discounts for entrepreneurship and the improvement of existing rates. At the same time, the state can concretize all the existing forms of tax discounts of the world countries in relation to this or other economic entities and this or other areas, which are intended to stimulate economic activity as follows: — finding opportunities to further reduce the rates of some taxes (especially profit tax and VAT); — application of various tax discounts, as well as exemption from taxes in the first stages of activity of enterprises operating in the real sector fields, which are intended to stimulate economic activity and to keep at the disposal of local executive authorities a part of taxes collected from business entities in order to accelerate the development of economic regions of the republic; — application of the discounted tax to investments directed by entrepreneurs to underdeveloped, as well as strategically important regions of the republic; — conducting tax audits on a selective basis and when there is a good reason for it etc.

2. Several tax discounts are carried out for many economic entities that support small business, including small business support funds, investment and leasing companies, credit and insurance companies, advertising and information companies and others by the government in the developed market economy countries. We consider that this practice of the world countries in the field of tax policy shall be kept in mind.

However, it should be noted that when using any form of international practice, it would be wrong to apply them blindly, to repeat them as they are, and it would not give the expected results. Therefore, we consider that the experience of the world countries in the field of tax discounts must be organically connected with the nature of the tasks and the direction of implementation of the requirements of the current stage of our economic development. These discounts include the application of low and different taxes for areas that are engaged in production in the early stages of its activity, necessary for the development of the economy, economic regions and types of activities, and exemption from tax for a certain period etc.

3. It is important to note that the same concepts used in normative legal acts in the field of accounting and tax accounting are often different. When incomes and expenses are classified, terms such as “incomes from sales”, “other incomes”, “expenses (sales expenses) on the ordinary activity types”, “other expenses” in modern accounting, and “incomes from sales”, “non-sale incomes”, “expenses related to the production and sales”, “non-sale expenses” in tax accounting are used. Contrary to the tax accounting, the modern accounting hasn’t used the term of reserves, but instead used the expressions of “estimated liabilities” and “estimated reserves”. Due to the differences between the terminological apparatus of accounting and tax accounting, it is necessary to determine which terms will be used in tax analysis.

4. The database of tax analysis is mainly the information of the tax accounting system that is independent of the accounting system of the organization or will be established on its basis. In the second case, the information source for tax analysis is actually the accounting system. Moreover, one of its information sources will be accounting (financial) reports to solve individual problems of tax analysis, for example, to assess tax risks according to generally available criteria, regardless of how the organization forms the tax accounting system.

The ability to use both the tax accounting system and the accounting system as a database for tax analysis, in our opinion, allows the use of the terms of both systems in tax analysis.
